Proposal Triage Tool :- (Flow chart)

CamScanner

Date:

How my design ranks sample:

1) Reviewer uploads pdf. ✓ sucess.
2) User selects category "Commercial Solar Installation".
3) Backend looks for "Commercial Solar Installation" in the database and fetches criteria and prompt against it.
4) Backend extracts text from pdf
5) Reviewer verifies the text and proceeds.
6) Backend sends the text and criteria, integrated into our prompts to AI.
7) AI separates the 5 proposals and starts evaluating. (sucessfully) (If fails, refer to human).
8) Check for notes; Proposal C has one, asking to rank it first as it's pre approved. AI does so.
9) Mandatory requirement check; Proposal B fails, no license → flagged ineligible.
10) When ~~of~~ mandatory requirement are checked for all proposals, AI looks for missing requirements.
11) Proposal D has no timeline mentioned → flagged.
12) AI Compares proposals and assigns scores.
13) AI returns a structured JSON for each proposal, specifying score against each criteria, status, and why decision was made.
14) Backend applies weights :

e.g: $(80 \times 0.30) + (80 \cdot 0.25) + (80 \times 0.15) + (100 \times 0.15) + (100 \times 0.15) = \boxed{86}$

15) Backend ranks on the basis of score and returns JSON
16) Result displayed to frontend & scored in db with audit logs.

Date:

17) A human sees the logs.

example;

→ Proposal D had missing timeline & wasn't ranked.

→ Reviewer considers that it should be ranked as proposal mentions "will be decided after detailed site assesment".

→ Reviewer gets this added as a note and re-runs evaluation, this time D gets ranked.

→ Reviewer looks at ranking and approves it.

→ End.

Final Ranking in JSON file as asked. (without the proposal D fix).
